

Connecting your website to Pluggz

Two pathways. Pick the one that matches your shop.

What has to happen. Pluggz sends a shopper to your website with a reference on the address. Your site keeps that reference. When the order completes, your site tells Pluggz the reference, your own order number, and the value. That is the whole job, and it is the same pattern as Awin or Impact: we tag the visit, you tell us when it turns into an order. We never need customer data, so please do not send names, emails, addresses or payment details.

	Shopify pixel	A site your team built
Work involved	Paste a snippet and connect it	About an hour
Reliability	An ad blocker can stop it	Not affected, and signed
Sales arrive as	Unverified, worth reconciling	Verified

We recommend the server call wherever a developer is available, including on Shopify. The pixel exists so that a shop with nobody to write code is not excluded.

What we issue you

A **brand key** that identifies your shop, for example pz_live_brand_a1b2c3..., and a **signing secret** that signs each message. The secret is for the server pathway only and must never appear in a web page. Both are issued the same day you ask, and nothing below authenticates until they exist.

Pathway 1 · Shopify

Nothing to write. We send you a snippet with your key already inside it.

1. In the Shopify admin, open **Settings**, then **Customer events**.
2. Click **Add custom pixel** and name it **Pluggz Affiliate Tracking**.
3. Under **Customer privacy**, set **Permission** to **Required**.
4. Set **Data sale** to: data collected does not qualify as data sale.
5. Paste the snippet into the code box.
6. Click **Save**.
7. Click **Connect**.

Step 7 is the one people miss. Saving a pixel does not switch it on. A shop can sit for a week wondering why no sales are arriving from a pixel that was saved but never connected.

The snippet catches the reference when a shopper arrives, keeps it for 30 days, and reports the order when the checkout completes. There is nothing to add to your theme and nothing to maintain.

Pathway 2 · A website your own team built

One change on the way in, one call on the way out.

Step 1 · Keep the reference when a shopper arrives

Every shopper we send lands on your own product page with **?ref=pluggz** and **pz=...** added. The **pz** value identifies that single click. Store it and keep it for **30 days**, or whatever attribution window we have agreed.

```
const pz = new URLSearchParams(location.search).get("pz");
if (pz) document.cookie =
  `pluggz_ref=${pz}; Max-Age=2592000; Path=/; SameSite=Lax; Secure`;
```

If you already store a click ID for another affiliate network, put ours in the same place. **Worth checking:** some sites drop the query string when redirecting to a login or a country selector, which loses the reference. Tell us if yours does and we will carry it differently.

Step 2 · Report the order from your server, once it is confirmed and paid

```
POST https://pluggzofficial.co.uk/api/track/sale
X-Pluggz-Key: pz_live_brand_a1b2c3...
X-Pluggz-Signature: <HMAC-SHA256 of the exact body, hex>
{
  "pz": "cmsnwhf8z0001ks24dkvv7dfl",
  "orderRef": "1002948",
  "value": 4499,
  "currency": "GBP",
  "soldAt": "2026-08-11T09:32:04Z"
}
```

Field	Required	Notes
pz	yes	the reference you stored in step 1
orderRef	yes	your own order number, so an order is never counted twice
value	yes	commissionable value in pence , as a whole number. 4499 is £44.99

currency and **soldAt** are optional: GBP unless agreed, and the time we receive it unless you send an ISO 8601 date.

Sign the exact bytes you send. This is what stops anyone else claiming sales against your account.

```
const signature = crypto.createHmac("sha256", SECRET).update(rawBody).digest("hex");
```

Replies, retries and refunds

200 recorded, or already recorded. **401** key or signature wrong. **422** we could not match that reference to a click, which usually means it is being lost in step 1, so please still send it. **429** too fast, retry with a short backoff.

Retries are safe: the same order number twice is recorded once, so a checkout that fires twice counts once. **For a refund**, send the same message with status cancelled and the commission is reversed. A creator is not paid until your return window has passed.

Test it, once

Ask us for a test link, open it in an ordinary browser, and check pz arrives and is stored. Place an order for a small amount. Pathway 2 should return 200 with a saleId; pathway 1 reports silently, so tell us when you have placed it. We confirm it at our end and the integration is signed off. Any questions, we are at **hello@pluggzofficial.co.uk**.
