

How to test Pluggz

For Lisa and Rachel · about twenty minutes · no technical knowledge needed

Before you start

Everything below is on the live site, so anything you record is real. Tell us before you begin and we will clear the test data afterwards.

Ask us for your own sign in rather than sharing one. The site records who approved what, and two people on one login makes that meaningless.

Have a phone to hand as well as a computer. Roughly half of what shoppers do happens on a phone, and it is the half most likely to look wrong.

1. The shopper journey

What someone sees when a creator posts a link.

- Open **pluggzofficial.co.uk** on your phone.
- Tap into a category from the homepage, then tap any product.
- On the product page, tap the button that takes you to the brand.

What should happen: you land on the brand's own website, on that exact product. The address will carry **ref=pluggz** and a **pz=** reference. That reference is how a sale is later credited to the right creator.

Worth noticing as you go: does every product have a picture and a price, do the creator names read properly, and does anything look broken on a phone.

2. Does the sale come back

The part that matters commercially. It needs the brand's side switched on first, and we will tell you when a brand is ready.

- Use a Pluggz link to reach the brand, as in step 1.
- Buy something on the brand's site, in the same browser.
- Sign in to Pluggz and open **Record sales**.

What should happen: the order appears within a minute, against the creator whose link you used, with the commission already split.

Verified and unverified sales

Verified	The brand's own server reported it and signed the message. The figure cannot have been altered, so it can be paid on.
Unverified	A pixel in the shopper's browser reported it. Far easier to set up, but an ad blocker can stop it and the value cannot be proved. Check these against the brand's own order list before paying commission.

3. The admin side

Each of these should take about a minute.

Screen	What to try
Approvals	Approve or decline a creator application
Brands	Add a brand, then copy what it gives you to send them
Products	Add a product by pasting the address of its page
Categories	Add a category, put it in the header, then delete it
Record sales	Upload a sales report and read the preview before recording
Payouts	Look at what is pending, verified and paid
Analytics	Check the numbers match what you have just done

Two things worth knowing. Adding a brand gives you either a tracking script or a key and a secret, depending on what their shop runs on, and that is what you send them. Uploading a sales report always shows a preview first, and nothing is written until you press record.

4. If something looks wrong

Send us these four things. With them we can usually find it in minutes. Without them we are guessing.

- What you were doing, in one line
- The address in the browser bar at the time
- What you expected, and what happened instead
- A screenshot, and whether it was phone or computer

Please avoid "it doesn't work" on its own. That sentence is true of several very different faults which have nothing in common, and it costs a day to narrow down.

What we already know about

So you do not spend time reporting these back to us.

- Some products have no price or picture. Those shops hide both from any automatic read, so they have to be filled in by hand.
- Some creator names show as their handle, and every follower count is zero. We are still waiting on the real names and numbers.
- The creator terms page is placeholder text.
- Payouts are tracked but no money moves yet, since Stripe is not connected.
